Useful Git Commands

Local Repository

- git config configure a user name, email address, editor, and other preferences once per machine.
- git init initializes a repository.
- git status shows the status of a repository.
- git add puts files in the staging area.
- git commit creates a snapshot of the staging area in the local repository.
- git diff displays differences between revisions.
- git checkout recovers old versions of files.
- · git lot history of commits to this repository

Remote Repository

- git push copies changes from a local repository to a remote repository.
- git pull copies changes from a remote repository to a local repository.
- git clone copies a remote repository to create a local repository with a remote called origin automatically set up.

Tips

- git pull before starting to work to minimize conflicts
- · divide and conquer: split projects into multiple files to minimize conflicts
- Always write a log message when committing changes.
- · .gitignore file tells Git what files to ignore.
